Using Ambient Vibration Array Techniques
for Site Characterisation

Monday, April 3rd 2006 to Friday, April 7th 2006
Institute of Geosciences, University of Potsdam, Germany

In recent years, the number of research papers dealing with ambient vibration analysis methods has increased considerably. Clearly, the interest in these methods originates from both the economical attractive cost benefit ratio and the straightforward data acquisition. Being a non-destructive passive technique, these methods also complement geotechnical and/or active geophysical methods within highly populated regions.

Within the SESAME project ("Site EffectS assessment using AMbient Excitation", EU-Project EVG1-CT-2000-00026) detailed research has been accomplished to identify the capabilities and limitations of ambient vibration analysis techniques. Within this context a set of software tools has been developed to ease the processing and interpretation of ambient vibration wave field recordings.

The main findings of the SESAME project however show, that ambient vibration array analysis techniques have to be applied with care. It requires not only a careful measurement, but especially the interpretation and the inversion of analysis results need a (self-)critical review. From these conclusions it has been agreed among SESAME-partners, that it is highly necessary to distribute the software tools together with adequate training.

The main purpose of this course is to achieve the necessary understanding among the course participants for the problems related to these techniques. By doing so, we try to enable a correct usage of the software tools and to avoid misuse of these methods ("black-box usage"). The course fees are intended to support current and future improvements of the software package, distributed under an open source and free license.

Due to the number of registrations we received with the first course in Grenoble 2005, we are organizing this second edition (and, who knows, a third one) to give everybody a chance to participate.

Contributions
organised by IGUP and LGIT
hosted by Institute of Geosciences at University of Potsdam
presented by Cécile Cornou, Matthias Ohrnberger, Marc Wathelet
supported by SESAME (EU-Project EVG1-CT-2000-00026) and Sismovalp (Interreg IIIB, Alpine Space) and all participants of the first edition.
Course outline

This is program which may be subject to slight changes in the future.

Tuesday

9:00-10:30  Basic array processing concepts (frequency wavenumber, f-k)  Lecture

- Overview array processing methods.
- The intuitive shift-and-sum technique in time domain and its transposition into the frequency wavenumber (f–k) domain.
- Discrete spatial sampling of the continuous seismic wave field (by small groups of seismic stations - arrays) : concepts of resolution and aliasing.
- Resolution and aliasing of simple linear array layouts and generalisation to bi-dimensional array settings.
- Relation between array geometry and resulting estimation capabilities: rules of thumb and the array response function.

10:30-10:45  Coffee break

10:45-12:15  Array geometry and f–k response  Exercise

- Design of array geometry with build_array software: optimum usage and functionalities.
- Building experience on how modifications in array layout affect the theoretical array performances.

12:15-14:00  Lunch break

14:00-15:30  Conventional f-k processing  Exercise

- Data management for array processing with Geopsy.
- Application of the conventional f-k algorithm to estimate the dispersion curves from synthetic signals

15:30-15:45  Coffee break

15:30-18:00  Conventional f–k processing  Exercise

- Building your own experience with f-k input parameters (frequency sampling, time window length, ...)
- From the discussion of the analysis results, new insight into dependencies between the observability of dispersion curves, array geometries and signal spectra (high pass filter effect and H/V).
### Wednesday

### Thursday

<table>
<thead>
<tr>
<th>Time</th>
<th>Activity</th>
</tr>
</thead>
</table>
| 9:00-10:30   | DC inversion Exercise  
- Introduction to dinver software.  
- Inversion of theoretical dispersion curve in order to identify critical issues.  
- Model parameterisation and parameter range ($v_P$, $v_S$, $\rho$), a natural way to introduce prior information and to reduce the non-uniqueness. |
| 10:30-10:45  | Coffee break                                                             |
| 10:45-12:15  | DC inversion Exercise  
- Inversion of the analysis results which have been obtained from f–k (standard and high-resolution) and SPAC computations the day before.  
- Combining the results of arrays with distinct apertures and geometries: decision on the usable frequency range for the inversion target. |
| 12:15-14:00  | Lunch break                                                              |
| 14:00-15:30  | Discussion of inversion results  
- Comparison of the inversion results obtained by the course participants with the true underlying model.  
- Discussion of the causes and the significance of apparent discrepancies between obtained inversion results. |
| 15:30-15:45  | Coffee break                                                             |
| 15:45-18:00  | Array analysis and DC inversion of test data sets I  
- Blind test experiment performed among the course attendees on a synthetic case.  
- Choice of the array layouts, analyse the selected records with f–k and SPAC techniques and finally derive the underlying velocity model. |

Suggested readings

All deliverables and reports of the SESAME project are available at (especially, D18.06, D19.06, D24.13 may be of interest): http://sesame-fp5.obs.ujf-grenoble.fr/SES_TechnicalDoc.htm.

Registration and Fees

To offer the best attention to each of the course attendees, the maximum number of participants is fixed to 15. A minimum of 8 registrations is required for the organisation of this cession.

Online registration (http://www.geopsy.org/arraycourse/login.php) is open until Friday March 10th 2006. If the number of applicants is greater than 15, the organisers reserve their rights to select the participants.

The fees include lectures, practical exercises, workshop dinner and coffee breaks. One computer per participant will be made available during the exercises. Profits will be devoted to the development and improvement of the SESARRAY softwares.
